

# Case 03: Nikhil's Unanswered Enquiries

Pre-class briefing for MESA AI and its Application · Cohort C4 · Class on 7 Oct 2026 · Prepared for Prithvi Patil

**The short version.** You are building an AI voice agent that answers Aangan Studio's incoming phone calls day and night, decides whether each caller is worth a designer's time using Nikhil's written rubric, books a call with the next designer in a round-robin rotation, sends that designer a complete handoff note on Telegram with an urgency tier, and feeds two views: a work queue for the front desk and designers, and a HubSpot dashboard for Nikhil showing what the system costs and what it earns. The one thing Nikhil asks for that you must **not** build is quoting per-square-foot prices. His own pricing file forbids it. WhatsApp and the web form are out of scope.

## 1. The case in one minute

Aangan Studio is an interior design studio in Pune (60 people, 14 designers). Referrals and Instagram bring plenty of enquiries, but they are handled badly. The pre-read gives these numbers:

| Fact                                               | Number             |
|----------------------------------------------------|--------------------|
| Enquiries per month                                | ~200               |
| No response within 48 hours                        | ~48%               |
| Conversion if answered in under 1 hour vs next day | 4× higher          |
| Arrive outside 10am–7pm                            | ~33%               |
| Front desk                                         | 2 people, 10am–7pm |
| Average project value                              | ₹8–14 lakh         |

A second pain sits behind the first: when an enquiry does reach a designer it is a forwarded message with no context, so the designer's first call repeats questions the front desk already asked.

### Nikhil's three asks, and what happens to each

| His ask                                                              | Verdict                                                                                                       |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| Answer every enquiry within five minutes, day or night               | Build it. A voice agent picks up instantly. Phone calls only.                                                 |
| Send worthwhile enquiries to designers with everything already asked | Build it. Qualify against qualified.md, then send a structured handoff note.                                  |
| Quote standard per-sq-ft pricing                                     | <b>Do not build. This is the Cut.</b> pricing.md says no number, range or per-sq-ft figure may ever be given. |

## 2. What the build is

The brief defines the scope. The tooling below is my inference, so confirm it in class.

- **Answer.** The agent picks up any call, including at night and on weekends, in the studio's voice.
- **Gather.** It asks the same things the front desk asks: what they want, location, size, timeline, who decides.
- **Qualify.** It applies the five criteria in qualified.md. Qualified callers get a consultation booked, unqualified ones are declined politely, and unclear ones get one direct question.
- **Hand off.** The designer receives a note with everything already asked, over Telegram.
- **Escalate.** Existing-client complaints and angry callers go to a human fast.
- **Two views, one system of record.** Every call creates a contact and a deal in HubSpot with the transcript and summary attached. The front desk and designers work from a queue of things to do, with Telegram alerts. Nikhil reads a HubSpot dashboard of topline and bottom line, so he never pulls numbers by hand again.

**Likely platform: Vaani.** You were given invite codes for the Vaani platform (yours is **F2F7A5KX**, listed under Section B with prithvi\_patil@pg27.mesaschool.co). Public docs describe Vaani as a platform for building AI voice agents that answer inbound phone calls, transfer to humans, query knowledge bases, run custom actions and show call summaries in an analytics dashboard, with configurable language-model, speech-to-text and text-to-speech providers. It claims 40+ languages, which matters because one WhatsApp enquiry (W03) was in Hinglish. I could not confirm in the files that class will use Vaani, so treat this as probable. Create your account before class if you haven't.

### How a call ends, and how a lead is allocated and booked

These rules come from your notes and the deck discussion. The tiers and skip rules are my proposals for Nikhil to confirm.

- **The agent decides during the call** whether the lead is qualified, and tells the caller straight away.
- **Qualified:** the agent says a named designer will call them shortly and gives the time, picked from that designer's calendar. Example: "Thank you, Priya. Meera, one of our designers, will call you on Thursday at 11:30am. Thank you for calling and sharing the information."
- **Not qualified:** a kind decline in the file's own words ("this may not be the right fit for us right now, but feel free to reach out if your timeline or scope changes"), after the read-back described in section 6.
- **Every call ends with the same line:** "Thank you for calling and sharing the information."
- **The booked slot is the designer's call to the customer.** The designer then arranges the consultation or site visit.

### Allocation: 14 designers, 14 calendars, round robin

- Each new qualified lead goes to the next designer in a fixed rotation. A pointer remembers who is next.
- Every designer has their own calendar. The agent has authority to check free time and book a slot in the assigned designer's calendar during the call, so the caller gets a personal touch from the first call.
- **If the next designer has no free slot** inside the lead's time window, or is on leave, the agent skips to the following designer and the pointer moves on from there.
- Designer calendars need working hours that include the times callers ask for. W01 wanted weekdays after 6pm or weekends only.

- Open questions for class: should large projects (for example the 5,500 sq ft villa in T12) skip the rotation and go to a senior designer, and what calendar tool can Vaani call? A tool that exposes free and busy time and can create events is needed (for example Google Calendar).

| # | Designer | #  | Designer |
|---|----------|----|----------|
| 1 | Aryan    | 8  | Tara     |
| 2 | Meera    | 9  | Samar    |
| 3 | Reyansh  | 10 | Nandini  |
| 4 | Ishita   | 11 | Advait   |
| 5 | Kabir    | 12 | Kavya    |
| 6 | Ananya   | 13 | Dev      |
| 7 | Vihaan   | 14 | Riya     |

Names are made up for the exercise. T09 in the transcripts already mentions a designer called Aryan, so I used that name.

### Urgency on the Telegram message

Every handoff states how important the client is and by when the designer must call. The standard turnaround is 48 hours, and faster tiers apply when the signals in the transcripts say the lead is hot. The deadline is also the latest time the agent may book, so slots are offered only within the tier's window.

| Tier            | Signals                                                                                                                                                                                                                             | Designer calls within   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Hot</b>      | Ready to start now or possession within about six weeks with a full scope (T15), a large project (villa in T12, 2,400 sq ft in T05, the 2,200 sq ft office in F05 with "speed matters"), or a lead who was failed before (T16, W08) | 2 hours in working time |
| <b>Priority</b> | Referral from a past client or builder (T01, T05, W06) or a clear start within about three months                                                                                                                                   | 24 hours                |
| <b>Standard</b> | Every other qualified lead                                                                                                                                                                                                          | 48 hours                |

The score comes from fixed rules on the extracted fields, not the model's feel. The message shows the tier, the deadline and the booked call time. A reminder goes to the designer at the halfway point, and a missed deadline goes to Nikhil. Nikhil's own numbers say an answer within an hour converts 4x better, so the 48-hour standard is a ceiling, not a target.

## 3. The pre-read: what is due and my starting answers

The brief asks for three things before class. I haven't done your homework for you, but here is the evidence the case gives you for each.

### A. Automation Brief: Pain, User, Outcome, Journey Today

- **Pain:** half of enquiries get no answer within 48 hours, a third arrive when nobody is in, and the ones that get through reach designers without context.
- **User:** think about two. The caller, who wants a quick, honest answer, and the designer, who needs a ready brief. Nikhil is the buyer and the dashboard reader.

- **Outcome:** every call answered immediately, only qualified leads reach designers, each with a complete note, and Nikhil sees cost against value.
- **Journey today** (from the transcripts): call rings in, front desk answers 10am–7pm or nobody does, details are taken by hand, a note is meant to be passed on, and sometimes it is lost. T16 and W08 are exactly this: the lead called, "someone" promised a callback, and nothing was logged.

## B. Nine Checks and the Cut

These are the deck's nine checks, in its three groups. Any No in a Kill Switch means don't build, in Sizing means build smaller, in Boundary means put a human exactly there.

| Check                  | Answer               | Evidence from the case                                                                                                                                               |
|------------------------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Kill switches</b>   |                      |                                                                                                                                                                      |
| 01 Problem real?       | Yes                  | ~48% of enquiries get no response in 48 hours; fast answers convert 4x better. T08, T16, W08.                                                                        |
| 02 Workflow repeated?  | Yes                  | ~200 enquiries a month; 11 of 20 phone calls follow the same path.                                                                                                   |
| 03 Input available?    | Yes                  | Live call audio, three rule files, 40 transcripts. Size, area and timeline must be asked for.                                                                        |
| <b>Sizing</b>          |                      |                                                                                                                                                                      |
| 04 Output valuable?    | Yes                  | A designer-ready handoff note on Telegram or email instead of a context-free forward.                                                                                |
| 05 Impact measurable?  | Yes                  | Time to answer, after-hours calls, qualified share, consultations, cost. Baseline conversion rate missing; ask Nikhil.                                               |
| 08 ROI worth it?       | Yes, pending cost    | About 1,000 call minutes a month against ₹8–14 lakh projects. Check Vaani's per-minute rates.                                                                        |
| <b>Boundary</b>        |                      |                                                                                                                                                                      |
| 06 Failure risk OK?    | Yes, with guardrails | A wrongly declined lead costs ₹8–14 lakh and a wrong price creates a commitment. Unclear budget or decision-maker is treated as qualified; complaints go to a human. |
| 07 Judgment protected? | No for pricing       | The designer sets the price at the consultation. pricing.md forbids any number, range or per-sq-ft figure.                                                           |
| 09 Owner clear?        | Yes, name them       | Nikhil owns the rubric and pricing decisions, designers own the consultation, you own the system. Name who takes escalations and who updates the files.              |

**The Cut: quoting per-sq-ft pricing. Killed by check 07** (secondarily 06). pricing.md is headed "indicative only, varies by site" and says no figure may be quoted. Its "must never say" list bans any number, range or per-sq-ft figure, including "It'll cost around..." and "For a 2BHK it's typically...". The only acceptable reply is the deflection line: pricing depends on the site, materials and scope, the designer will explain at the consultation, and the agent can book it now. T02, T13 and F07 show callers pushing for a ballpark and the human front desk refusing each time. The human goes exactly at the consultation.

*"Quote our standard per-sq-ft pricing" → Killed by 07. The price depends on the site and spec, so the designer decides at the consultation.*

The PDF says "the one thing Arjun has described wanting". The founder in this case is Nikhil, so Arjun looks like a leftover from another case template.

### C. Components Map (swimlane, as in the deck)

Columns are the stages and rows are the actors and systems, like the FlixMatch example. The AI is a row, not a column.

| Lane                              | Trigger                                       | Input                                                         | Context                                                      | Processing                                         | Output                                                  |
|-----------------------------------|-----------------------------------------------|---------------------------------------------------------------|--------------------------------------------------------------|----------------------------------------------------|---------------------------------------------------------|
| <b>Caller</b>                     | Calls the studio number, any hour             | Answers questions: project, area, size, timeline, who decides |                                                              |                                                    | Hears outcome: booked, declined or later start          |
| <b>Vaani voice agent</b>          | Picks up instantly                            | Collects the fields; never asks budget                        | Loads the three rule files                                   | Escalation check, five criteria, picks an outcome  | Speaks the outcome; logs every call to the dashboard    |
| <b>LLM</b>                        |                                               |                                                               |                                                              | Judges fuzzy cases (T14 son calling for parents)   | Writes the handoff summary                              |
| <b>Rule files</b>                 |                                               |                                                               | services.md, qualified.md, pricing.md (deflection line only) |                                                    |                                                         |
| <b>Designer calendars (14)</b>    |                                               | Free and busy time requested                                  | Working hours, leave                                         | Round-robin pick, skip if no slot                  | Call booked in the designer's calendar                  |
| <b>Telegram</b>                   |                                               |                                                               |                                                              |                                                    | Handoff note reaches the designer                       |
| <b>Humans (Nikhil, designers)</b> |                                               |                                                               |                                                              | Take escalations (T09, T16); price at consultation | Consultation held                                       |
| <b>Front desk and designers</b>   | Telegram alert on a new handoff or escalation | Mark outcomes: booked, held, proposal, won, lost, not a fit   | Transcript and summary on the card                           | Work the queue by deadline                         | Callbacks done, declines reviewed, consultations booked |
| <b>HubSpot (Nikhil)</b>           | Agent creates contact and deal per call       | Stage and outcome updates from the team                       | Source, project type, area, size                             | Pipeline, conversion and cost roll-ups             | Founder dashboard: topline, bottom line, leaks          |

### View 1: the work queue for front desk and designers

These people don't need charts. They need to know what to do next and how long they have. Designers receive each new lead as a Telegram message like the example in section 7, and the queue below is the same list in HubSpot, so nothing depends on scrolling a chat. Everything here is a list sorted by deadline, with the transcript one click away, and the same items pushed to Telegram.

| Who        | Queue                                        | What they do                                                                                                                                   |
|------------|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Front desk | Escalations, with a 15-minute callback timer | Angry existing clients (T09, T16) go to Nikhil or a senior person. Mark done.                                                                  |
| Front desk | Callbacks owed                               | Missed and dropped calls (T08, T17) and callers waiting on an answer. Call back, log the result.                                               |
| Front desk | Declines to review                           | Read the transcript and reason. One click to reverse a wrongful decline and send it to a designer.                                             |
| Front desk | Bookings made by the agent                   | Check for clashes, reschedules and callers who ask to change the time. The agent books, a person handles changes.                              |
| Designer   | My new leads                                 | A card with the handoff note, qualification result, flags (such as "budget not stated"), tap-to-call and a suggested slot. Accept, call, book. |
| Designer   | Leads untouched after a set time             | Fast response drives conversion, so aging leads turn red and ping the designer, then Nikhil.                                                   |
| Designer   | My consultations this week                   | Prep from the transcript and summary before the visit.                                                                                         |
| Designer   | Proposals awaiting a decision                | Follow up. Mark won, lost or not a fit, with a reason.                                                                                         |
| Both       | Agent alerts                                 | A call the agent couldn't classify, or a guardrail trip such as an attempted price quote.                                                      |

**Why the status updates matter:** every button press is also the data Nikhil's dashboard needs. If the team doesn't mark outcomes, revenue can only be estimated, so keep it to one tap per stage. This is also why Telegram suits the handoff.

## View 2: the founder dashboard in HubSpot

A CEO reads topline (is revenue growing), bottom line (is it worth what it costs) and leaks (where money is escaping). Ten tiles in that order:

| Group       | Title                                                                                                      | Why Nikhil cares                                                          |
|-------------|------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Topline     | Revenue won this month and quarter, against target                                                         | The headline number.                                                      |
|             | Pipeline value, weighted by stage                                                                          | What next month's revenue looks like.                                     |
|             | Funnel: calls, qualified, consultation held, proposal, won, with the conversion at each step               | Shows which step to fix next.                                             |
|             | Win rate and average project value (₹8–14 lakh)                                                            | Quality of the pipeline, not just volume.                                 |
| Leaks       | Speed to lead: share answered within 5 minutes, after-hours calls captured, time to first designer contact | The 4x conversion lever he already believes in.                           |
|             | Revenue leaked: unanswered, wrongly declined and stalled leads, valued at average project x conversion     | The cost of the failure risk, and the clearest proof of the tool's value. |
|             | Declines reviewed and reversed                                                                             | Confirms the agent isn't throwing away good leads.                        |
| Bottom line | System cost: monthly total, per qualified lead, per consultation, per won project                          | The brief asks for the tool's own cost on the page.                       |
|             | Return on the tool: extra revenue attributed ÷ cost                                                        | The single number that justifies keeping it.                              |
|             | Designer scorecard and lead source: leads, response time, win rate, and lost reasons by source             | Where to add capacity and where to spend on Instagram or referrals.       |

**Bottom line needs one input from Nikhil.** The case gives no project margin, so cost and return can be shown against revenue only. Ask for an average gross margin to show contribution. Also ask for a baseline conversion rate, and compare against last month's manual numbers (48% unanswered, a third out of hours). Say "associated with", not "caused by". Check which HubSpot plan Aangan has, since custom dashboards and reports are limited on some plans.

## 4. The data you'll build against

### services.md: what Aangan does and doesn't do

- **Does:** end-to-end residential (2BHK onwards, partial home of 2+ rooms, or a single room with full execution) and commercial offices up to about 3,000 sq ft.
- **Does not:** architecture or structural work, decor-only advice, furniture sourcing alone, Vastu-only consultation, restaurants, hotels, retail, gyms, or projects outside Pune city and PCMC.
- **Service area:** Pune city (Kothrud, Baner, Aundh, Wakad, Koregaon Park, Kalyani Nagar, Viman Nagar, Hadapsar, Magarpatta, NIBM, Kondhwa, Undri, Shivane, Warje, Erandwane, Deccan) and PCMC (Pimpri, Chinchwad, Pimple Saudagar, Pimple Nilakh, Ravet, Hinjewadi). Not Talegaon, Lonavala, Nashik or Mumbai.
- **Timelines:** design 3–4 weeks, execution 8–16 weeks, no execution start if the project must be ready in under 6 weeks.

## qualified.md: Nikhil's five criteria for forwarding a lead

| # | Criterion                                                                       | Handling                                                                                   |
|---|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| 1 | Real project (design plus execution), not just advice                           | Unclear on 1, 2 or 3: ask one direct question                                              |
| 2 | Inside Pune or PCMC                                                             |                                                                                            |
| 3 | Realistic timeline: execution possible within 8–10 weeks of consultation        |                                                                                            |
| 4 | Budget broadly right, only if the caller volunteers a number that clearly fails | Unclear on 4 or 5: do not push, treat as qualified and note the uncertainty in the handoff |
| 5 | Decision-maker is on the call or represented and authorised                     | Two or more fail: decline gracefully                                                       |

**Does not disqualify:** not knowing exactly what they want, calling out of hours, asking about price, being unsure about style, a rented apartment, or a single-room project. **Never probe budget.**

## 5. What the 40 transcripts show

The sample is 20 phone calls, 10 WhatsApp threads and 10 web forms. Use the phone calls (T01–T20) to test your agent, since that is the scope.

| Group                                | Calls                                                                                  | What it teaches                                                                                                                  |
|--------------------------------------|----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Clearly qualified, book consultation | T01, T02, T05, T06, T11, T12, T13, T14, T15, T17, T20                                  | The happy path. T11 (rented flat) and T14 (son calling for his parents) test the "does not disqualify" and decision-maker rules. |
| Politely decline                     | T03 Nashik, T04 advice only, T10 budget ₹1–1.5 lakh, T18 180 sq ft pod, T19 restaurant | Each maps to a criterion. Decline kindly and don't waste a designer's time.                                                      |
| Timeline borderline                  | T07 (Diwali in three weeks)                                                            | Cannot do now, but a November start works. Offer the later date.                                                                 |
| Escalate to a human                  | T09 angry existing client, T16 lost callback                                           | Not a new enquiry. Route to Nikhil or a senior person with a 15-minute callback promise.                                         |
| Missed or dropped                    | T08 missed 10:47pm call, T17 line dropped then called back                             | T08 is the after-hours pain in one example. T17 shows the agent must handle repeat callers.                                      |
| Pricing pushback                     | T02, T13                                                                               | Deflect every time, then still book. Both callers did book.                                                                      |

### Gaps and conflicts to raise in class

- **Timeline rules disagree.** qualified.md says 8–10 weeks from consultation, services.md says 6 weeks minimum lead time. Decide which one the agent uses and say why.
- **An unwritten rule.** In T18 the front desk says commercial projects are typically 500 sq ft or more. That minimum is in neither file.
- **Budget edge cases.** Criterion 4 never asks about budget. It only reacts if the caller volunteers a number that is clearly far below the project (T10: ₹1–1.5 lakh for a kitchen and bedroom). "Clearly

below" has no number in qualified.md, so borderline cases like F08 (₹4–5 lakh for a living room and kitchen) need a line from Nikhil. A high budget never disqualifies. Vague answers such as "reasonable" or "will discuss" count as qualified, and the handoff note should say "budget: not stated". Using pricing.md silently as a yardstick is different from quoting it, but the file says indicative only.

- **Language.** W03 is in Hinglish. Phone callers in Pune may switch languages.
- **Missed-call evidence is thin.** Only one phone transcript is a missed call, yet the brief says a third of enquiries arrive out of hours.

## 6. Managing the risk of a wrongly declined lead

---

The risk is lopsided. Declining a good lead can cost ₹8–14 lakh and nobody ever sees it, while forwarding a bad lead costs a designer a short consultation. The design therefore leans towards forwarding, and every decline must be checkable by a person. This is the answer to check 06.

### How wrongful declines are reduced

- **Decline only on stated facts.** The agent must name one criterion and point to what the caller said (T03 Nashik, T19 restaurant). If it can't, it forwards.
- **Read back before declining.** "Just to confirm, the site is in Nashik?" catches mishearing, accents and Hinglish.
- **Hard rules in code.** Service area is a lookup against services.md. An area not on the list is forwarded with a flag, not declined.
- **Three outcomes.** Qualified, declined, and forward with a flag. Unclear budget or decision-maker means treat as qualified and note it. Unclear on criteria 1–3 means ask one question.
- **Soft and reversible declines.** The caller hears the "feel free to reach out if your timeline or scope changes" line, and every declined call keeps its transcript, recording and reason.
- **Daily decline review** by the front desk or a designer at first, shown in the front-desk review queue and the founder dashboard.
- **A human takes over** when the caller pushes back on a decline.

### Transcript cases that could go wrong

- T07 (Diwali in three weeks): offer a later start, don't treat the timeline as a fail.
- T14 (son calling for parents): qualifies, because the parents attend and decide.
- T11 (rented flat) and T04 (just exploring): a rental is fine, and exploring is a re-engage case (W10 suggests 4–6 weeks).
- T18 (180 sq ft pod): the 500 sq ft minimum isn't written in any file, so ask Nikhil before the agent declines on it.
- T17 and T08 (dropped and missed calls): never a "no". They trigger a callback.

### How to measure it before launch

- Label the 20 phone transcripts against qualified.md and confirm with Nikhil. The known-good set is T01, T02, T05, T06, T11, T12, T13, T14, T15, T17 and T20. The target is zero wrongful declines on it.
- In production, review every decline at first, sample later, and track declined callers who later prove to be good leads.
- Give designers a "not a fit" button with a reason, so wrongful forwards feed back into the rules.

**How to frame it for Nikhil:** today about half of enquiries get no response in 48 hours, so the current wrongful-decline rate is already huge and invisible. The agent needs to beat that, make its mistakes visible,

and make them cheap to reverse.

## 7. Decisions you will have to defend

---

### Handoff channel: Telegram, as discussed in the deck

Each qualified lead reaches the designer as a Telegram message, the moment the call ends. The reasons to give if Nikhil asks: designers read their phones fast, and speed to lead drives conversion; a short structured message is easier to act on than an email; the buttons on the message let designers report status in one tap, which feeds the founder dashboard; and the same note is saved on the HubSpot deal as the permanent record, which covers what email would have given.

**Example handoff message** (built from T01, details anonymised; the tier, designer and time are illustrative):

```
To: Meera (next in rotation)
PRIORITY: referral from a past client · Call by Thu 3 Sep, 10:23am (24h) · Booked: Thu 3
Sep, 11:30am
New qualified lead: Priya, Kothrud (Dahanukar Colony)
Project: full redesign of 3BHK, kitchen, living room, both bedrooms, ~1,400 sq ft carpet
Timeline: done by March, no rush
Decision-maker: owner, husband aware and happy to go ahead
Budget: not stated
Source: referral from Shruti Joshi (previous client, Aundh)
Called: 2 Sep, 10:23am, 4 min · Phone: on the message · Transcript: link
Flags: none
[Accept] [Called] [Held] [Not a fit]
```

### The founder dashboard: cost and value

Nikhil wants to see what the system costs and what it generates, including the cost of the tool itself.

- **Cost:** calls × average minutes × per-minute platform and model rates. In the 19 phone transcripts the average call lasts about 4.9 minutes, so roughly 200 calls a month is around 1,000 minutes. I don't know Vaani's rates, so look them up in the platform.
- **Value:** enquiries answered inside five minutes, share qualified, consultations booked, hand-offs sent. The case gives the 4x conversion lift for fast answers and a ₹8–14 lakh average project, but not a baseline conversion rate, so ask for one or state an assumption.

## 8. Before class checklist

---

- Sign up to Vaani with invite code F2F7A5KX and try creating a test agent.
- Write your Automation Brief, Nine Checks and Components Map using sections 3 to 5.
- Know the Cut and the reason for it.
- Know why Telegram is the handoff channel (section 7), how round robin and the 14 calendars work, and how the urgency tiers are set.
- Know what a voice agent does in order: listens (speech-to-text), thinks (a language model with your instructions), speaks (text-to-speech), and calls tools such as saving a lead or sending a message. Delay between turns matters on a phone call.

- Know how a wrongly declined lead is caught (section 6) and how designers will mark outcomes for the dashboard.
- Be ready to explain what the agent says when it doesn't know, and when it hands over to a human.

Sources: MESA Case 03 problem statement PDF; Case 03 Seed Data folder (services.md, pricing.md, qualified.md, Aangan\_Sep 2026\_Enquiries.pdf); Vaani invite-code spreadsheet; Vaani overview at [mvdcs.omind.ai/developer-guide/overview](https://mvdcs.omind.ai/developer-guide/overview). The nine checks come from the class deck screenshot. Per-call figures are my own calculation from the transcripts.
